

Fujitsu Intros Externus DX2007

Written by Marco Attard
09 May 2014

Fujitsu Storage claims to remove system bottlenecks and improve infrastructure efficiency with the Externus DX200F, an all-flash array praising latencies of 0.5ms or less for I/O-intensive applications.

It also automatically allocates resources according to task priority when combined with the Quality-of-Service feature of the Fujitsu Eternus SF 16 software platform storage.

A remote copy feature allows easy backups to an Eternus DX series unit using lower-price nearline disks. Thin provisioning support is also enabled, allowing admins to set virtual available capacity regardless of physical SSD capacity.

The Externus DX2007 is available now in Fujitsu's home Japan, with a global launch to follow at a yet announced date.
