29 June 2017

Luxul announces the availability of the Epic 5-- a high-performance gigabit router aimed at custom installers, with superior WAN-to-LAN performance and advanced capabilities beyond the traditional router.

Epic routers come in two basic configurations, the Epic 4 series and the Epic 5 series. While Epic 4 routers offer 600+ Mbps WAN to LAN performance, the Epic 5 supports gigabit WAN to LAN (900+ Mbps) speeds, making them ideal for customers with access to gigabit service or future-proofing for when local ISPs start offering gigabit service.

In addition, the Epic 5 features dual-WAN capability with load-balancing and failover control, advanced security and remote access features, and a console port for local configuration. Also included is a platform optimising the user experience in smart homes, workplaces, retail establishments and more, as delivered through Luxul and 3rd party applications running on the Epic platform.

The first such application is enhanced content filtering from Router Limits, and additional applications (including Domotz remote network monitoring) are planned for future development. Installers can implement such features at their discretion, making a perfect base on which to build recurring revenue.
