

Neutrik Locks Down USB-C Cables

Written by Alice Marshall
01 November 2018

Neutrik launches the mediaCON product family-- a selection of robust, lockable USB-C cables and panel sockets designed for use with data rates up to 10GB/s (USB 3.1), 100W power and 10000 mating cycles.

"We observe that with increasing digitalisation, the demand for high-quality and robust data connectors is steadily increasing," Neutrik says. "More and more manufacturers rely on USB Type-C technology. However, a lockable and reliable interface to connect professional audio components, storage media, cameras, monitors and computer hardware has been missing."

For ease of handling, installers can mount the space-saving flush-mount panel socket with push-pull locking mechanism from either the front or the rear. The majority of the moulded cable connector is concealed when mated and locked in place. The result not only ensures a reliable connection, but also protects against dirt and mechanical stress.

mediaCON cables with bend protection are available in lengths of 0.5 and 1m. All mediaCON cables and panel sockets are compatible with standard USB-C products.
