The latest addition to the HPE Small Business Solutions line is the ProLiant MicroServer Gen10 Plus, a server the size of a typical hardcover textbook offering "industry-leading" automation, remote management and security, and Intel Pentium and Xeon E processors.

Aimed at SMB customers and available on a subscription-based basis, the ProLiant MicroServer Gen10 Plus is small and light enough to allow carrying and placement in any-size environment. It carries HPE-exclusive "silicon root of trust" technology, meaning it extends security protection to the silicon-level. The company claims it protects data, detects issues and rapidly recovers from malicious firmware attacks, and is also recognised by insurers in the Marsh Cyber Catalyst program.

The cloud-based InfoSight for Servers management tool allows SMBs to monitor server health and use predictive analytics to predict and prevent issues before business is impacted. Integrated Lights Out 5 (iLO5) allows customers to configure, monitor and update servers seamlessly, and customers can run core business applications on-premises in the office and concurrently consume cloud-based services using Microsoft Azure.

HPE Intros Compact Servers for SMBs
