TRENDnet Presents AP Management Software

Written by Marco Attard

20 November 2015

The TRENDnet IP67 weather rated outdoor wireless access point line gets free AP Management Software designed to accommodate varying network setups and simplify device management.

The web-based management tool allows network administrators to configure multiple outdoor access points simultaneously, change configurations or update firmware remotely, and view network status reports for each supported unit. It can be used within large and extensive networks, and inherits current configuration settings.

Centralised firmware upgrades allow the easy simultaneous upgrading of all units, while quick settings transfers minimise overall downtime. Users can also create custom configurations of individual and group access points.

"The complexity of today's wireless networks requires skilled technicians for basic setup and network maintenance," TRENDnet says. "TRENDnet's new web-based management software cuts down overall administration time, and provides the necessary tools to keep your wireless network up and running smoothly."

The AP Management Software is compatible with the TRENDnet TEW-738APBO and TEW-739APBO access points, as well as theTEW-676APBO and TEW-455APBO legacy models.
