Fluke Networks announces Fiber QuickMap, an enterprise fiber troubleshooter providing immediate visibility for the most common causes of failure and poor data centre fiber network performance.

It even covers high-loss events, such as multimode fiber breaks, with 6-second test times.

It is usable straight out of the box, thanks to one-button testing and no need for user setup.

Different kit configurations including additional diagnostic tools are available-- including power meters, sources and fiber inspection microscopes.
