

Synology Surveillance Station 6.1

Written by Bob Snyder
16 December 2013

Surveillance Station is Synology's fully-integrated network video recording (NVR) solution. And the newest version, 6.1, introduces numerous additions and enhancements that make Surveillance Station a more robust NVR, and combines storage solutions.

Edge recording and center management are powerful tools to help mitigate bandwidth concerns, and maximize the storage of remote cameras. With edge recording, primary data storage is kept where cameras are located. Center management keeps camera control at a single location, and helps to minimize unnecessary footage transmission.

Surveillance Station 6.1 introduces the Synology Web Object, allowing Windows browsers (Chrome, Firefox, and Internet Explorer) to function without Java. It Integrates with Windows Active Directory and LDAP for improved control over permissions.

On-screen controls now appear within active windows, enabling greater control in live-view. There is now **support for over 1700 cameras**, and 6.1 also introduces Device Pack to speed camera integration.

Surveillance Station 6.1 is a free download to supported Disk and RackStation hardware
