

Dual Password Security From USB Stick

Written by Marco Attard
28 April 2011

Integral launches a successor to its Crypto Drive, the Crypto Dual-- with dual password protection and dual OS compatibility.

Compatible with Windows and Mac OS, it carries AES 256-bit hardware encryption with FIPS 197 validation (Certificate no. 1137).

Users must setup their password (requires a high strength alphanumeric 8-16 character password) before use due to the Dual's mandatory encryption, while an optional Master password override allows data recovery if a user forgets their password.

If one fails to enter the correct password for 6 times, the Dual automatically resets itself and erases all data.

It requires no software installation, and is also compatible with endpoint security software.
