---

Collective defense and network behavioural analysis provider IronNet Cybersecurity announces the IronDome collective defense platform is available for companies of all sizes, including small and midsize companies.

As the company puts it, SMBs are just as prone to cyber attacks as its current customer base of Fortune 500 companies. In addition, collaboration with a more diverse range of companies increases threat insight sharing, improves high-order analysis at the industry level, and enhances defenses for all members of the collective.

“Nation-state attacks are becoming increasingly more sophisticated and coordinated, leaving individual companies and organizations to fend for themselves,” IronNet says. “However, today’s business reality is that many organisations are tightly interconnected in a complex ecosystem of peer companies, partners, and suppliers. Our defense platform enables our customers to anticipate and visualize potentially malicious behavioral anomalies in their networks across companies and sectors to collectively defend themselves from targeted attacks. Collective defense is our collective responsibility; by democratising our capabilities we can work together more effectively across industry and government to protect ourselves.”

IronDome enables organisations to join resources and envision potential threats to collectively defend against targeted attacks. The platform uses behavioural analytics, AI and machine learning to network traffic data, and combines the knowledge of the best offensive and defensive cyber operators with "world-class" mathematicians and data scientists.

IronNet offers IronDome at a range of tiers tailored to the needs of Fortune 500 companies,
