

Integrating DLP Across Enterprise

Written by Marco Attard
24 May 2012

Trend Micro builds Data Loss Prevention (DLP) into its Control Manager enterprise management platform-- combining data protection and threat prevention at client, server and gateway levels.

The system allows the creation, application and enforcement of both data- and threat-protection policies from a single point, with no need for extra servers, endpoint agents or administrative consoles.

Other Control Manager features include a web-based central security management console, customisable dashboard, threat statistics, customisable reporting, ad hoc query capabilities and configurable alerts.

The solution is scaleable and offers a DLP solution for midsize to low enterprise customers lacking the resources for standalone DLP offerings.
