Deciso launches the OPNsense firewall appliance-- a turnkey open source firewall alternative offering an easy-to-use yet powerful security platform powered by the AMD G-Series system-on-a-chip (SoC).

According to the company the G-Series SoC allows for a stable, cost effective and durable product, as well as gigabit network security. Meanwhile the embedded low-power design eliminates high cooling requirements, since the quad-core version has a typical power usage of only 20W.

Meanwhile the OPNsense firewall software includes features such as load balancing, high availability and captive portal, all without the licensing costs of similar proprietary solutions.
