UK-based wifi service provider Wifi Spark adds a security and internet content filtering enforcement boost to its 100000 access points across Europe through the integration of the Cyren WebSecurity platform.

Wifi Spark has an extensive portfolio of wifi hotspots, with locations including the National Exhibition Centre (NEC) in Birmingham and hundreds of NHS hospitals.

Meanwhile the Cyren cloud-based security platform collects and analyses 17 billion pieces of threat data from around 500000 global points of presence in 200 countries, protecting 600 million global users.

"Today's technology user expects ubiquitous, fast access to the Internet via wifi," Cyren says. "With the Cyren WebSecurity platform, we make these capabilities available on a global scale for providers such as Wifi Spark without any hardware or software."
