EMC plans to shorten the time cloud storage platforms take to be set up through its Atmos Cloud Delivery Platform.

The company says its solution-- a software-only system working only on Atmos software and hardware-- deploys cloud storage platforms in days, not months.

The Atmos platform allows customers to create and monitor accounts without any IT personell or service provider intervention. It also enables user identity provisioning, chargeback (for private clouds) and billing integration (for private and public clouds).

Meanwhile a metering module measures bandwidth and storage capacity consumption at a user level.

Alongside the platform EMC introduces a cloud delivery portal for companies without their own portal.
