---

Lenovo joins forces with Cloudistics to expand the ThinkAgile portfolio-- the CP series, a composable "cloud in a box" solution consisting of Lenovo ThinkSystem hardware and Cloudistics software.

The CP series comes complete with fully-integrated infrastructure, application marketplace and end-to-end automation of software-defined networking, compute and storage. Management comes through software-as-a-service portal, and the result promises the agility of the public cloud paired with the security of a private cloud.

Further features include integrated high availability, backup, remote replication, usage metering, live help and support, and multi-layered, multi-tenant security. The marketplace provides a curated selection of applications for deployment, while compute and storage come in plug-and-play, scale-out units.

“As a global company that is unencumbered by legacy, Lenovo is uniquely positioned to not only listen to our customers and understand their pain points, but also develop revolutionary solutions that eliminate IT roadblocks and accelerate their business growth,” the company says. “The ThinkAgile CP Series is another example of how Lenovo is driving the industry forward by enabling customers to truly own their cloud experience in a secure, scalable and streamlined way.”

Lenovo offers 2 CP series options-- the CP4000 (a 1x 2U compute node enclosure with 10Gb SFP+ network modules and 2-4 compute nodes) and the CP6000 (with up to x10 compute node enclosures (up to x4 nodes per enclosure), 10Gb SFP+ network module and 1-5 storage blocks).
