LinkSource announces its latest technology, IronTrap-- offering clients tools to administer, provision, monitor and manage multiple cloud environments.

Using IronTrap users are able to manage dedicated servers, public cloud, private cloud, devices and sites from multiple providers from their worksite, with advanced monitoring alerting and reporting through a single portal. System administrators can find all servers available-- whether Windows or Linux-- from a single control panel.

A network monitor alerts administrators following failure detection, while taking preconfigured corrective action. It also features a ticketing system, storing alert tickets based on issue priority. Alerts take place via email, mobile, SMS or audio alerts.

It supports IPv4 and IPv6 and is scaleable, with the company testing it with 100000 monitored devices and servers with 1m availability and performance checks.
