

Cloud Hosting for ISVs

Written by Marco Attard
20 April 2011

Logicalis launches its Independent Software Vendor (ISV) Cloud Hosting Programme, allowing ISVs access to its cloud platforms, as well as support in their migration efforts.

The company's hosting platform supports most operating systems, including all major hypervisors, Windows, Linux and Unix platforms.

Logicalis says its cloud hosting platform also supports hybrid operating systems and applications, with Oracle, Windows and VMWare residing together in the same hosted environment.

The ISV market is one of the UK's bigger technology sectors, where ISVs sell their solutions directly to end users who then own and operate the server, storage and network platforms.

The company will also be running a "Home for ISVs" open day on May 12th and Jun 16th 2011, to allow potential clients to explore its services.
