---

OnLive and Juniper Networks announce their partnership in enterprise cloud-based service development, with Juniper providing the hardware for OnLive's network infrastructure.

OnLive is best known for its on-demand video games and applications services.

The partnership's first entry will be in the remote desktop field, which will incorporate OnLive's video compression technology and Juniper's Junos Pulse client-- a solution the companies say will "be indistinguishable from a local one".

The technology should work on any number of devices-- from PCs to mobile devices and TVs.

Hardware-wise, OnLive's integrated network has Juniper EX series ethernet switches, MX series 3D universal edge routers and SRX series gateways, as well as Juniper's QFabric networks solution.

OnLive says its take on the remote desktop will only find use for media-rich content and bandwidth-intensive application delivery. What's left to wonder is how it will fare in comparison with Citrix's remote desktop solutions.
