

New Data Center Factory for i/o

Written by Marco Attard
17 February 2011

i/o opens a new factory to produce its ANYWHERE fully integrated data center modules.

With an initial capacity of up to 18 MW of data center modules per month, the factory is set to start off its assembly lines by Q2 2011's end.

ANYWHERE modules include all infrastructure required for always-on data centers, with an architecture scaling to 1000s of cabinets in a single deployments. On top of all this is the i/o OS, a fully integrated data center monitoring, alarming, remote control and management system.

It provides real-time information on critical service infrastructure while integrating the power and energy recovery layer into enterprises' IT stack.
