DattoCon Barcelona has Datto announce enhancements to all product lines, including the global availability of Datto Networking Managed Power, more Business Continuity and Recovery (BCDR) hardware and a new pricing model for SaaS Protection cloud backup.

Datto Networking Managed Power includes the MP10 wifi-connected smart plug, and is a cloud-managed device allowing MSPs to remotely monitor and manage the power of customer devices.

Meanwhile the Datto Unified Continuity BCDR appliance line gets up to 48TB of all-flash storage, with local failover virtualisation and "near instant" recovery. Cloud Agent Templates give MSPs the opportunity to efficiently enforce standards and consistency across the fleet. The SaaS Protection, O365 and Google Apps backup solutions get simpler pricing, with either time-based or infinite cloud retention options.

The company follows on the English language release of Autotask PSA 2018.2 with German and Spanish options, as well as efficiency improvements and a redesigned client portal homepage. Datto RMM 6.1 gets more efficient and reliable workflow to manage network devices, along with upgraded Splashtop remote control capabilities able to handle the simultaneous connection of 2 support technicians during a remote control session.

The Datto Networking line gets 2 new products-- the D200 and MP10. The D200 is a high-performance edge routing solution available with industry-leading LTE options, LTE Management and full 4G LTE failover, while the MP10 is a single-port smart plug giving MSPs the ability to remotely or automatically power cycle connected devices.

On the File Backup and Sync side, Endpoint Backup gets new Admin roles to delegate accounts to end-clients and Access Links enabling users to securely access backed up files anywhere, from any device. Workplace updates include numerous integration enhancements for Microsoft Office, including the Outlook plugin and Smart Badge functionality, both improving file sync status and version history visibility.

Updates to Datto product integrations include a new REST API for the Continuity line, furthering the Datto open ecosystem by providing a standard mechanism for partners to integrate. Datto also announces enhanced web content filtering powered by TitanHQ for Networking Edge Routers, including the DNA and D200.

“This is an exciting time of innovation at Datto, with new products and features across all our product lines focused on saving our partners time and helping them deliver reliable services to their end customers,” the company says. “Our new entry-level router, as well as REST API are making our products even more accessible to the market.”
