Extron Ships CCI Pro 700 for Conference Room Control

Written by Roger Douglas
18 May 2016

Extron Electronics announces the immediate availability of the **CCI Pro 700**, the industry's first control system user interface optimized for conferencing, collaboration, and AV control.

The CCI Pro 700 compact design includes a 3.5" color information display, a numeric keypad, and backlit buttons. The information display can be used to show contact information, call directories, and call status. Buttons directly below the display can be used to navigate custom lists and menus.

The CCI Pro 700 also offers the convenience of **Extron System Templates**. These free, professionally-designed audio conferencing templates provide a starting point for configuration with downloadable GC Plus files that include GUI layouts and sample system logic.

"With the new CCI Pro 700, we have created a conferencing and control interface that strikes a balance between sophistication and ease-of-use," says Casey Hall, VP Sales and Marketing for Extron. "This fully customizable and configurable interface fills a critical niche within collaboration environments between a standard conference phone and an elaborate, touchpanel-based system."

The CCI Pro 700 is configured using **Extron Global Configurator Plus** or **Global Configurator Professional**

and
GUI Designer software
and works in conjunction with any
Extron IP Link Pro control processor
. It operates using standard network infrastructure and is easy to install with cost effective Ethernet cable.
