Extron announces the StudioStation-- a quick, simple and convenient hardware solution for one-touch recording of high quality video and audio presentations.

To turn on the system, one simply inserts a USB stick and presses the record button to start recording. The system powers up automatically, and once the recording is complete, removing the USB storage puts it back in standby mode and turns off any devices connected to the power controller. The core components fit securely in an equipment rack, with only the control panel and USB connection visible to the user.

Default recording is configured at 720p at 5Mbps and produces an MP4 media file. An embedded web page allows one to customise the default configuration to meet the needs of many applications.

Systems are customisable to support any installation, and are ideal for flipped classroom recordings, lecture capture, product presentations, board meetings, rehearsal spaces, deposition recordings, moot courts and any other application in need of convenient, one-button recording.

The StudioStation is shipping now.
