

InFocus announces SimpleShare-- a point-to-point presentation solution for wireless connectivity and sharing of videos, presentations, documents, data and more.

Designed as a cable replacement, SimpleShare is device-agnostic. It allows users to share HD video and sound wirelessly to any display with an HDMI input from any PC, Mac, DVD player, tablet, camcorder or other devices in real time. The system features simple plug-and-play installation with no software, downloads or network management, making it user-friendly to implement. Users can switch between up to 254 presenters with the click of a button.

Security is included through WPA2 encryption. Servicing a radius of 15m from the receiver, the AES-CCMP algorithm is a cipher key encryption with variable key size and changes at varying intervals.

SimpleShare comes in 3 bundled solutions-- the base model (INA-SIMS1), aimed at small meeting room use, includes x1 transmitter and receiver. The Presentation System (INA-SIMPS1) is a complete conference room solution with x3 transmitters and a charging station. The Touch Presentation System (INA-SIMINT1) supports up to x3 presenters with wireless touch control from a touch display panel and allows users to annotate anything they present from their source device, as well as draw and write on a built-in digital whiteboard.
