Extron starts shipping the HC 403-- a collaboration system aimed for meeting rooms and huddle spaces featuring built-in control capabilities and connection with occupancy sensors to automate display power and source switching.

Created for professional integration, the HC 403 wallplate transmitter blends with surrounding decor while the HC 403 receiver can be mounted beneath a table or behind a display. It works with GlobalViewer Enterprise for a networked AV system management solution to monitor and support systems.

The wallplate transmitter and scaling receiver extend video, audio and power up to 70m over a single CATx cable for maximum performance and reliability. It features x1 HDMI input and x1 VGA input at the transmitter, and x1 HDMI input at the receiver. Extron scaling technology in the receiver ensures maximum image detail and colour accuracy.

Ethernet connectivity facilitates management, monitoring and control of AV devices over standard network infrastructure, while built-in control functionality eliminates the need for additional equipment. Customers can add an Extron ShareLink gateway to support BYOD, allowing users to share content from a wide range of mobile devices.
