

Yamaha Ships SIP-Based CS-700 SIP

Written by Frederick Douglas
11 April 2019

Yamaha starts shipping the CS-700 SIP video sound collaboration system-- a product the company claims is the first to integrate PBX and UC applications, allowing customers to bridge telephone calls and web conferences.

The Video Sound Bar family features an adaptive beamforming microphone array, x4 Yamaha speaker elements and a wide-angle HD camera. The CS-700 SIP model introduces VoIP capability, with built-in connections for VoIP and USB for UC applications. Thus, users can not only conference via audio and video from any UC platforms, they can also bridge VoIP and USB calls directly from the device.

Aimed at huddle rooms and other small conferencing environments, the series includes two models-- the CS-700AV and CS-700SP.
