Wildix moves into room video conferencing as it announces Wizyconf-- a web-based video conferencing system for meeting and conferencing rooms the company claims eliminates the complexity associated with such solutions.

“Legacy video conferencing systems can be difficult to use and often require frequent IT support while newer desktop, laptop or mobile solutions don’t provide the quality and flexibility many users require,” Wildix says. “This new solution brings greater simplicity, collaboration and performance to video conferencing, enabling more effective group-to-group communications across offices and with customers or partners.”

Wizyconf is an immersive integrated video conferencing system complete with wide angle 4K static camera, pan-tilt-zoom (PTZ) web camera, two studio-quality microphones, a three-display mobile cart and a Chrome OS PC. It supports up to three 65-inch displays, and the dual-camera setup is flexible enough to supplement room video from the static camera with a focused display of a presenter or whiteboard provided by the web camera.

An intuitive remote control, designed specifically for Wizyconf, manages all system functions and makes setup easy. Operating off Chrome OS with WebRTC eliminates update or driver issues, further enhancing simplicity while providing a high level of security.

The Wizyconf follows the 2018 introduction of Wildix Ubicon Huddle, a turnkey desktop WebRTC-based video conferencing system supporting 1080p video. Through Wizyconf and Ubicon Huddle SMBs can tailor a room video conferencing solution to their needs, while partners get a single-vendor video conference offering.

The two solutions complement the Wildix UCC platform, which leverages a web-based PBX with WebRTX to provide fully unified desktop and mobile communications integrating voice, web conferencing, chat and email in a single secure portal. The solution is available exclusively through channel partners.
