TrueConf launches TrueConf Group, a videoconferencing endpoint with built-in MCU boasting both high-quality video and audio clarity available as a ready-to-use kit for meeting rooms.

TrueConf Group offers 1080p60 video, and enables users to share any content as a separate video stream thanks to H.239 and BFCP support. The endpoint also supports content sharing from a USB drive in several clicks. Integrated multipoint capabilities allow up to x8 connections on a single conference without need for an external bridge.

Built-in noise reduction and echo cancellation provide high-quality audio, while H.265 and H.264 SVC codecs offer HD quality while using half the bandwidth compared to older video conferencing systems. An included IR remote allows control of the endpoint, communication sessions or participant cameras. The system features native compatibility with conference room systems, allowing seamless integration with video conferencing endpoints, content sharing, remote camera control and custom video layouts.

TrueConf Group fits into the existing TrueConf ecosystem and is compatible with video collaboration solutions from the company. Customers can run video meetings with up to 250
