Revolabs FLX wireless conference phone is now available to European markets.

Combining wireless, high-quality wideband audio, 128-bit encryption, integrated Bluetooth, support for analog and IP, and a sub-\$1000 price point, Revolabs FLX shows the evolution of the conference phone into several distinct components, adding freedom to the choice of placement of the speaker, microphones, and dial pad.

Available with compatible Revolabs microphones, the FLX supports a lapel microphone, worn by one person; an omni-directional tabletop microphone that captures the sound of six to 10 participants; and a directional tabletop microphone that enables audio capture from two to three people. Because the FLX dialer operates like a telephone for handset calls and enables the setup of conference calls, there is no need for a separate desk and conference phone.

The Revolabs FLX can also serve as the audio interface with most major brands of video conferencing equipment, useful as the unified communication concept hits the small- to medium-sized conference room.

Designed specifically for small- to midsized conference rooms, executive offices, and SoHo, Revolabs FLX is available at an MSRP of €999.
