

Nureva Intros HDL300 System

Written by Marco Attard
12 January 2017

Nureva announces the ISE 2017 debut of the HDL300, an audio conferencing system armed with innovative Microphone Mist Technology poised to establish a new platform for audio conferencing.

The HDL300 conferencing system promises a natural listening experience for people calling into meetings where participants are actively collaborating and working at different locations in the room. Patent-pending Microphone Mist technology places 8192 virtual microphones throughout the room to pick sound from any location, before a combination of hardware and sophisticated algorithms simultaneously process sound from all virtual microphones.

The result, Nureva says, is a natural listening experience, with all participants being heard clearly regardless of location in the room, direction faced or voice volume. The system is compatible with popular conferencing software such as Skype, Jabber, Zoom and GoToMeeting, and is optimised for small to mid-sized meeting spaces.

The HDL300 will be on show at ISE 2017 before global shipping starts on Q2 2016.
