02 February 2018

Extron announces the immediate availability of the HC 404-- an easy-to-use AV system for collaboration spaces featuring built-in control capabilities and integration with occupancy sensors.

The HC 404 is a low-profile number, allowing discrete mounting behind a table or display. It connects seamlessly with GlobalViewer Enterprise, providing an elegant AV system management solution to monitor and support all collaboration spaces throughout the enterprise. The switching transmitter and scaling receiver work together to extend video, audio and power up to 70m over a single CATx cable.

Connectivity comes through two HDMI inputs and one VGA input at the transmitter, and one HDMI input at the receiver. BYOD support can be added through an Extron ShareLink wireless collaboration gateway, providing means for users to share content from a variety of mobile devices.

"For customers searching for a simple collaboration solution that works right out of the box, the HC 404 system delivers," Extron says. "The HC 404 automates common functions and enables users to quickly and effectively work together using any device, simply by plugging in their laptops or tablets to share projects."
