

Cloud-Based Product Management With Nureva Console

Written by Marco Attard
17 January 2020

Following the release of the HDL200 mic-array/speakerbar combo, Nureva launches Console, a cloud-based platform featuring a single platform for the management of Nureva audio conferencing systems across multiple locations.

Console combines a web client installed on Windows and Mac meeting room computers and a cloud-based dashboard users can access remotely. Together, they create a platform to enroll, configure and maintain every Nureva audio system. As a byproduct, customers can also configure any HDL system using a Mac PC.

Through Console IT managers can remotely determine the state of a Nureva audio system to check if it is set as the default audio device, if the firmware is up to date and whether it is powered and connected to a computer. System information, such as model details and serial numbers, is also available. Once a Nurevea audio system is enrolled through Console, customers receive an additional year of warranty, from 2 years to 3.

Looking forward, Console provides the infrastructure for deep integration between Nureva audio and other 3rd party solutions. The company promises the frequent addition of further functionality to Console, such as means to integrate room booking and control systems with the aforementioned HDL200 system.

Console will be available to all Nureve audio conferencing customers at no additional cost at end February 2020.
