ClickShare's new dual display functionality means when two displays are connected to the ClickShare Base Unit, the latter will automatically activate 'Dual display mode' and show the content on both screens.

This is especially useful for businesses with a video conferencing system: When they don't use the video conferencing mode, they can now present information (PowerPoint, MS-Excel spreadsheet, etc.) on two screens.

On top of this dual display functionality, two more features that had been announced at ClickShare's official launch will soon be available: ClickShare's full compatibility with an iPad -- via Apple TV or HDMI to DVI video cable -- and audio.
