

Haivision brings out **Calypso**, a media capture and management platform for viewing, recording and sharing live video content.

Designed for simulation, skills assessment and training applications, Calypso enables users to quickly turn live activities and events into media assets by capturing and sharing live and on-demand content in real-time.

With Calypso, subject matter experts can monitor multiple sessions, choose to record any or all of the contributing streams, assign metadata to sessions or events in real-time, and elect to share or remove viewing privileges at any time. Calypso's scalable platform provides H.264 recording performance, with up to 50 HD streams simultaneously recorded on a single server appliance.

As a multi-source network video recorder Calypso combines extensive multi-source capabilities with real-time metadata (**HotMarks™**) to give organizations an effective way to make assessments based on understanding aggregated information. Designed for mission-critical content requirements, Calypso provides simplified record and review workflows, allowing users to share, authorize and de-authorize live and on-demand media assets instantly.

Haivision Demos Calypso Media Capture & Management
