

Wifi Design on the Cloud

Written by Marco Attard
11 July 2013

Xirrus releases a free cloud-based design tool for the creation of wireless networks-- Xirrus Wifi Designer-Cloud, a self-service application for the placement access points and arrays.

The Wifi Designer-Cloud models the wireless coverage of Xirrus APs and arrays together with the characteristics of the deployment location (including wall construction materials) to create an optimised design.

"Rather than conducting an active survey using physical equipment and manpower— which can be expensive and cumbersome— network planners can simply use our cloud based tool to design and dimension a Xirrus wireless network," Xirrus says. "Wifi Designer-Cloud provides time and cost savings in determining project scope and the bill of materials (BOM)."

As a Software-as-a-Service (SaaS) offering Xirrus Wifi Designer-Cloud requires no installation or maintenance, and is available now via the link below.
