Xirrus claims to solve the wifi access challenges of BYOD and IoT with EasyPass, a service suite for the management of mobile device connections to wifi networks with "minimal" IT involvement.

Sold as a cloud-hosted software-as-a-service (SaaS), EasyPass provides control over wifi networks through a single console. It is device-agnostic, and promises lower installation costs and easy installment and management.

The EasyPass suite consists of 3 modules-- Onboarding (handles device-independent secure access for known users), Guest (allows users to self-register for wifi access) and Voucher (enables guest access with pre-created voucher codes).

“Users expect to connect anywhere, anytime without waiting. It’s no longer enough to simply provide wifi-– today, connecting must be fast, easy and secure,” Xirrus says. “EasyPass addresses the pain points IT departments face due to the growing number of disparate devices on their Wi-Fi networks.”

The EasyPass suite is available now.
