YESCO introduces a new large format, high resolution sign system for use in interior applications.

The Y80PDDN is an 80" double-sided LCD kiosk system that incorporates many of the same components used in YESCO's outdoor interactive LCD product line yet is optimized for high performance interior applications.

"We wanted to show how our modular systems could also be used for interior applications," comments J.R. Williams of YESCO. "By taking our outdoor LCD system and modifying it for interior applications we have developed a double-sided kiosk that can be used in hotels, casinos, museums and airports."

The Y80PDDN comes standard in a grey powder coated finish, but is also available in custom colors or finishes, including wood grains, marble, or stainless steel. It uses quad pixel high contrast Sharp LCD technology that also "consumes the lowest power in the industry."

The Y80PDDN features an embedded computer and player-- as well as an optional proprietary YESCO system monitoring tool that can ensure its performance.
