NEC Display Solutions will share an open platform modular approach with **Raspberry Pi**, enabling integration of Raspberry Pi's devices with NEC's displays.

Raspberry Pi is responsible for spurring the development of very low-cost personal computers after generating interest from a large IT DIY community.

Being an incremental part of NEC's Open Modular Intelligence (OMI) platform, the Raspberry Pi 3 seamlessly embeds with NEC's new range of **professional P and V Series** large format displays.

The new displays allow easy access to embedded intelligence smartly connected to Internet of Things (IoT) for digital signage as well as presentation use. The design of the displays suits for installations in any environment. You can customise the screens to individual needs.
