Tridensity offers no-glasses 3D displays for digital signage. in different sizes. At CeBIT 2011, they used four 42" multi-viewer 3D monitors to get quad-HD resolution for a 3D experience.

The 3D displays are "tiled" together contiguously or overlapped in order to form one large screen.

For digital signage, Tridensity offers 19", 24", 37" and 47" multi-view 3D displays.

In the case of 3D kiosks and 3D info terminals, single-viewer displays are available.

Combining hardware, software and support into one package, Tridensity 3D monitors are, according to the company, "the only 3D monitors with an integrated PC running a network-capable Linux-based specifically developed for the digital signage market."
