Scala Enterprise Reaches 11.07

Written by Frederick Douglas
13 June 2019

Scala announces the latest release of the Scala Enterprise core digital signage platform, version 11.07. The update features bolstered software security, enabling authentication using single sin-on (SSO) and secure password enforcement through stricter policies.

On the security side, Scala Enterprise 11.07 includes support for SAML 2.0 and ADFS 4.0 based SSO for one-click access for enterprise users. Customers can also enable password policies such as required length, strength and duration to mitigate the risk of unauthorised access, and create IP whitelists to manage lists of trusted IP addresses.

The release also introduces four umbrella features for Content Manager, the Scala content scheduling and management platform, as well as over 50 additional enhancements. Enhanced Workgroup settings increase security and compliance, and Content manager gets support for MSSQL 2016 and 3rd party security updates.

"Scala has progressively put security at the forefront of our priorities, which is evident with the release of Scala Enterprise 11.07," the company says. "Globally, we have an increased focus on security related features. We're taking actions to be proactive in mitigating vulnerability, safeguarding products and systems, and increasing security measures across the board."

Scala Enterprise 11.07 is available now as an update for customers under current Scala Maintenance.
