Arthur Holm presents its **Dynamic 3** in the EMEA region for the first time during Infocomm MEA. Dynamic 3 is the latest addition to Arthur Holm furniture that integrates monitors and the maker says, it's “the only system on the market that is electrically foldable, closable and rotatable.”

Its' predecessor (Dynamic 2) was limited to boardroom and conference room applications because only people sitting in front of the screen could view its content. Now the new system incorporates **a 180° rotation mechanism**. This allows content sharing between several people, making it a viable solution for information counters at hotels, banks, insurance and retail applications besides of course meeting, conference and board rooms.

The housing opens and closes using a motorized mechanism (a manual option is available); a security mechanism halts the movement if it detects any objects in the way. The display can be operated in both vertical and horizontal positions – the screen image re-orientates itself automatically. The up, down, and rotation movements can be activated through the push buttons or remotely; the Arthur Holm ERT interface and the AH net communication protocol have been developed to control, configure and diagnose Arthur Holm monitors.

The system itself is built in a solid anodized block, with a sleek, high-end look, while a shallow depth enables integration into special tables. Two screen sizes are available: 17in (Full HD) and 19in. Keyboard and mouse can sit neatly on an integrated tray, which rises as the monitor

opens and touch screen is also an option.

Dynamic 3 can also be customized with microphone, voting system and by adding USB or any other needed connectivity. HDCP compliant from the next month of November, its electronic board Arthur Holm says is “the most complete of the market in terms of inputs and remote control and remote diagnose capabilities.”
