Gefen's Video Wall Controller provides an easy way to create HD imagery across four displays stacked in a 2x2 configuration.

The Video Wall Controller outputs HD video up to 1080p full HD from a single PC or video source using DVI connectivity. When combined with computer applications, resolutions are supported up to 1920x1200. One DVI input is split to four DVI outputs connected to four hi-def displays. Video can be spread across all four displays or just three, two or one display, giving users additional control over the creative content.

Independent bezel adjustments control borders when the image is spread across multiple displays, allowing users to crop and relocate each border to maintain image continuity (a particularly useful feature in large-scale HD video apps).

A rugged metallic enclosure makes it ideally suited for rental and staging as well as static digital signage presentations.
