At InfoComm, Viewsonic brought out a new MultiView video wall software solution. In addition to displaying large screen HD video across multiple displays, users can display individual HD content on up to 9 displays using a single video.

A typical MultiView solution consists of ViewSonic's large-screen LCD commercial displays, a mounting kit from Premier Mounts, ViewSonic's MultiView video wall software to configure and manage the video wall and a PC solution.

Michael Holstein, VP business development, says "Typical video wall set-ups can run companies tens of thousands of dollars. By eliminating video splitters and the need to connect monitors to multiple sources, ViewSonic is able to offer this highly cost-effective solution."

ViewSonic's MultiView video wall software, powered by Germany's **friendlyway**, offers multi-dimensional configurations via a single video source. Any standard PC with a high-performance graphics card and Windows 7 can be used to design, develop, and control the video wall (whether it's a 1-dimensional, 1x5 video wall such as a quick service restaurant menu board, or 2-dimensional video wall with up to 5x5 displays).

ViewSonic's models featuring the internal video wall capability include the 52" CD5230, 42" CD4230, CD4232 (Full HD) and 42" CD4230T touch compatible commercial displays. Each display features an elegant slim bezel, commercial metal housing and VESA mounting. Also featured in the bundle is a Premier Mounts pedestal mounting solution.
