ViewSonic launches the VG2860MHL-4K-- a 4K/UHD (3840x2160) resolution monitor the company says is designed to cater for the needs of enterprise applications such as financial trading and content editing.

The display features 10-bit colour processing to deliver 1.07 billion colors as well as up to 96% sRGB. A MultiPicture function supports picture-in-picture (PIP), picture-by-picture (PBP) and equally split horizontal and vertical images from up to 4 video inputs.

Connectivity comes through DisplayPort 1.2 and Mini DisplayPort 1.2, both supporting 4K resolution at 60Hz. Further ports include HDMI, MHL and x4 USB.

Flicker-free technology and a blue light filter ensure more comfortable viewing. Installation comes through VESA standard holes for bracket and wall mounting, while the included stand supports tilt, swivel, height adjustment and pivot.

"Business users tend to use multiple monitors in their current setups, in the finance, trading, and even editorial sectors," the company says. "UHD monitors negate the needs for complicated and often expensive setups by allowing them to be replaced with a single UHD monitor. With PC and monitor life cycles of 3 to 4 years, switching to a UHD monitor is a future proof choice that allows companies to save money for assets refresh."

The VG2860MHL-4K is available now.
