Planar debuts "the industry's first infinity, zero bezel 60", 70" and 80" family of LCD displays, configured for multiple solutions within digital signage applications."

Described as "engineered from the ground up to be the digital signage displays for large format LCD needs," Planar says its **UltraLux Series** are all ADA compliant for indoor advertising, retail/corporate brand communications and large format way-finding applications. They really aren't totally bezel-less, but they do have the smallest bezel of any commercial LCD we've seen so far.

Every model is native 1080p, less than 3" deep and have a hinged mount and kickstand design to provide easy tilt-out access to the electronics modules on the back.

Each one features an edge-to-edge layer of Planar ERO glass that gives the display the appearance of having an "infinity edge" and that protects it in high-traffic areas.
