15 February 2012

In addition to its pro displays and monitor installations, Sharp unveils the prototype of its interactive whiteboard, with a diagonal screen size of more than two metres (80")—and available to the European retail trade for the first time in this size.

Featuring an intuitive interface, the whiteboard is designed for efficient and creative teamwork. By combining the touch panel with a touch pen and detection software, modifications can be immediately integrated in existing drafts on the display.

Developed specifically for Sharp touch-screen LCD monitors, Sharp Pen Software allows anyone to smoothly and easily operate: once documents created on any application software have been imported as images and displayed on the touch-screen, users can quickly write and draw directly on the screen surface using the touch pen or a finger.

Screen images can be enlarged or rotated, and handwritten notations such as text and drawings can be selected and moved around. Everything on the screen can be saved or exported for printout to keep accurate records of brainstorming or formal meetings.
